Subject : recommendation letter for Oghenefegor Ugbine

Dear Professor,

As an assistant-professor at the Ecole des Mines de Saint-Etienne, I was part of the supervision team of Oghenefegor Ugbine's master thesis. His work was on Finite Elements Models Updating, and more specifically the identification of the parameters of an elasto-plastic constitutive law from experimental machining data. On the technical point of view, it consists in the implementation of a Levenberg-Marquardt optimization algorithm on Python, with calls to the industrial Finite Elements solver Abaqus through the `os` Python library.

In the course of his work with me, Oghenefegor Ugbine has demonstrated his willingness to learn and to adapt in line with the supervisors' remarks. His dedication made him to overcome the unavoidable difficulties encountered in research and to produce a functional proof-of-concept implementation.

Oghenefegor Ugbine is primarily a manufacturing scientist, but he made the necessary efforts to develop his skills in programming and algorithmics to write a functional code. I am confident he will in the future further develop his skills and become able to write optimized and reader-friendly code.

If you need more information, or if you think you could benefit of a live discussion with me on this recommendation letter, feel free to email me to settle a telephone appointment.

Sincerely,

Renaud Ferrier
